I am a full-stack developer with over five years of experience building and maintaining Ruby on Rails applications, with shipped, well-tested features across several codebases: SciNote, Marble, Open Food Network, and my own OneView Properties. I enjoy taking a problem from a rough idea through design, code review, and production, and I am comfortable working in remote teams where communication matters. Most recently, I designed and launched a property-management platform for the Cameroonian market, which meant learning payments, e-signatures, and data-protection rules well enough to build them in. My background in mathematics and teaching still shapes how I work, and I like explaining things simply and getting the details right.

WORK EXPERIENCE

Lumina Tech Systems (OneView Properties) Founder and Lead Engineer, Remote Jan 2026 – present

Property-management platform for landlords and property firms in Cameroon, in production

- Designed and built oneviewproperties.com end-to-end on Rails 8 and Hotwire, from an empty repository to a live product in about three months of active development, with around 2,700 RSpec examples covering models, requests, jobs, and browser flows.
- Modelled a domain with real financial consequences (tenancies, invoicing, rent reconciliation, audit history) carefully enough that landlords can rely on the records, and made it importable from the spreadsheets they already keep.
- Learned the local mobile-money and data-protection rules and turned them into working code: a provider-neutral payments layer with an MTN MoMo integration, and consent, retention, and deletion flows for Cameroon's 2024 data-protection law.
- Built a native e-signature flow rather than paying for a third-party service, taking on the learning curve to remove a per-signature cost, and built a Hotwire Native Android app so tenants and caretakers can use the product on their phones.
- Set up and operate the production environment: Kamal deployments to separate web, worker, and database servers, PostgreSQL backups, Cloudflare at the edge, Sentry monitoring, and a GitHub Actions pipeline with supply-chain hardening.

Open Food Network (open source) Full-stack developer, Remote Jul 2024 – present

Open-source Rails marketplace connecting local farmers and consumers

- Contribute features and fixes, mostly around product creation and order-cycle workflows, with 20 pull requests merged so far.
- Take on maintenance work that keeps the project healthy, such as removing the `awesome_nested_set` gem, upgrading dependencies, and moving legacy CableReady code to Hotwire, and work through review with the maintainers on GitHub and Slack.

SciNote ELN Full-stack developer, Remote Jun 2023 – Apr 2024

Electronic lab notebook (Rails, Vue.js) used by research labs to manage experiments and inventory

- Delivered features consistently in a large codebase, working from Jira tickets and Figma designs alongside product, design, and QA, with 240 pull requests merged in ten months.
- Built the inventory item card (stock management, reminders, barcode and QR labels, item relationships) and the global search page across tasks, results, reports, and assets.
- Extended the public V2 API with endpoints for protocol step and result elements and wrote their documentation, alongside less visible work like the Open Vector Editor integration, jQuery 3 upgrade fixes, and Content Security Policy tightening.

Marble Full-stack developer, Remote Mar 2022 – Feb 2023

Marble Academy, a Rails course platform, and Marble Flows, an interactive flow builder

- Worked across both products, shipping features and fixes through a staging-to-production release flow, with 159 pull requests merged in eleven months.
- Built and maintained the Academy payments and subscription layer on Stripe, including iDEAL for euro customers, integrations with HubSpot, Mailchimp, Pabbly, and TeamTailor, and Czech, Chinese, and German localisation.
- Cut flow page loads on Marble Flows by up to 5 seconds by batching GraphQL resolvers to remove N+1 queries, an approach I later [wrote up on Medium](#), and moved Academy views to Hotwire and Stimulus with Sidekiq for background work.

Microverse Code reviewer and mentor, Remote Jan 2021 – Dec 2021

Remote software-development bootcamp

- Reviewed student Rails and JavaScript projects and led feedback sessions, giving detailed written reviews on structure, testing, and readability that helped students stay in the programme.

Ministry of Secondary Education, Cameroon Mathematics teacher Mar 2014 – Apr 2020

- Taught algebra and calculus at secondary level for six years, preparing students for national exams and engineering-school entry.

TECHNOLOGIES

Ruby on Rails (up to Rails 8), Ruby (up to 4.0), Hotwire (Turbo, Stimulus, Hotwire Native), JavaScript, Vue.js, React, GraphQL, REST APIs, Tailwind CSS, Kotlin (Android), PostgreSQL, Redis, Sidekiq, Solid Queue, RSpec and Capybara, ActionPolicy, PaperTrail, Kamal, Docker, AWS S3, Heroku, Cloudflare, Sentry, GitHub Actions, Stripe, mobile-money APIs, Jira, Figma

EDUCATION AND LANGUAGES

University of Bamenda BEd Mathematics, second-class upper division 2010 – 2013

Microverse Full-stack developer certification (remote pair programming, algorithms, data structures) 2020 – 2021

Languages: English, native-level fluency · French, fluent
